Latihan 1 (Analisis Jaringan Internal Docker & Service Discovery):
1. Mengapa penggunaan localhost pada Node-RED di dalam kontainer Docker menyebabkan kegagalan koneksi?

Penggunaan localhost pada Node-RED di dalam kontainer Docker akan menyebabkan kegagalan koneksi karena localhost mengacu pada kontainer Node-RED itu sendiri, bukan pada laptop atau kontainer broker MQTT. Ketika Node-RED mencoba terhubung ke localhost:1883, koneksi akan gagal jika tidak ada broker MQTT yang berjalan di dalam kontainer Node-RED tersebut. Oleh karena itu, alamat server broker harus diisi dengan nama layanan mqtt agar Node-RED dapat terhubung ke broker MQTT yang benar.

2. Bagaimana mekanisme Docker Embedded DNS Server dan Bridge Network bekerja?

Docker menggunakan Embedded DNS Server untuk menerjemahkan nama layanan menjadi alamat IP internal kontainer yang sesuai. Ketika kontainer node-red dan mqtt-broker berada pada jaringan Docker yang sama, yaitu Bridge Network yang dibuat oleh Docker Compose, Node-RED dapat menemukan broker menggunakan nama layanan mqtt. Docker kemudian menerjemahkan nama tersebut menjadi alamat IP internal kontainer broker sehingga komunikasi dapat dilakukan melalui port MQTT 1883 tanpa harus menentukan alamat IP secara manual. Mekanisme ini mempermudah komunikasi antarkontainer dan memungkinkan alamat IP berubah tanpa perlu mengubah konfigurasi Node-RED.

Latihan 3 (Implementasi Filter Histeresis pada Rule Engine):

Latihan 4 — Analisis Mekanisme Volume Mount & Persistensi Data
1. Apa yang terjadi jika baris volume dihapus dari docker-compose.yml?

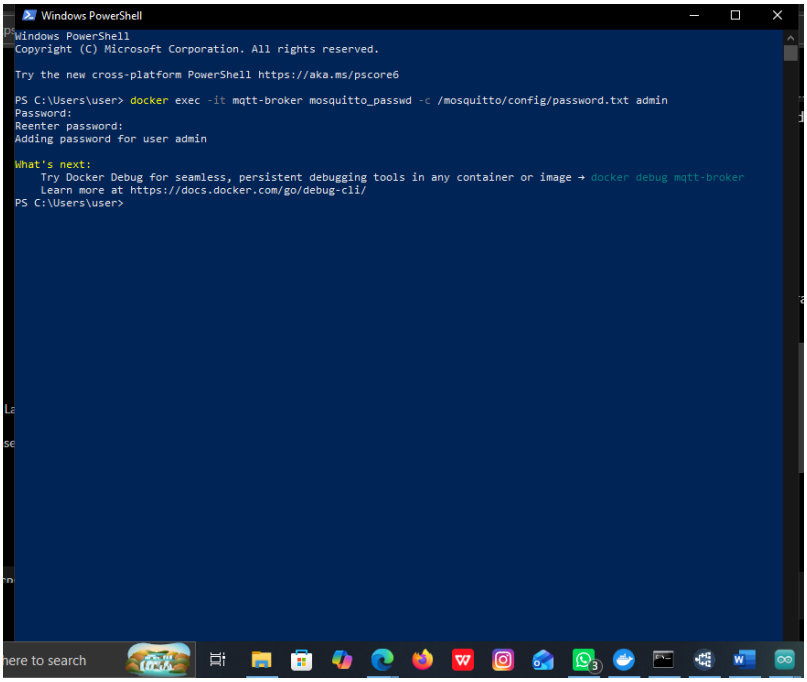

Jika baris volume ./nodered:/data dihapus dari file docker-compose.yml, data alur kerja (flow) dan konfigurasi Node-RED akan disimpan di dalam lapisan penyimpanan kontainer. Apabila kontainer dihentikan dan dihapus menggunakan perintah docker compose down, kemudian dibuat kembali, data yang tersimpan di dalam kontainer lama dapat hilang. Akibatnya, alur kanvas Node-RED yang telah dibuat berisiko hilang dan harus dibuat ulang.

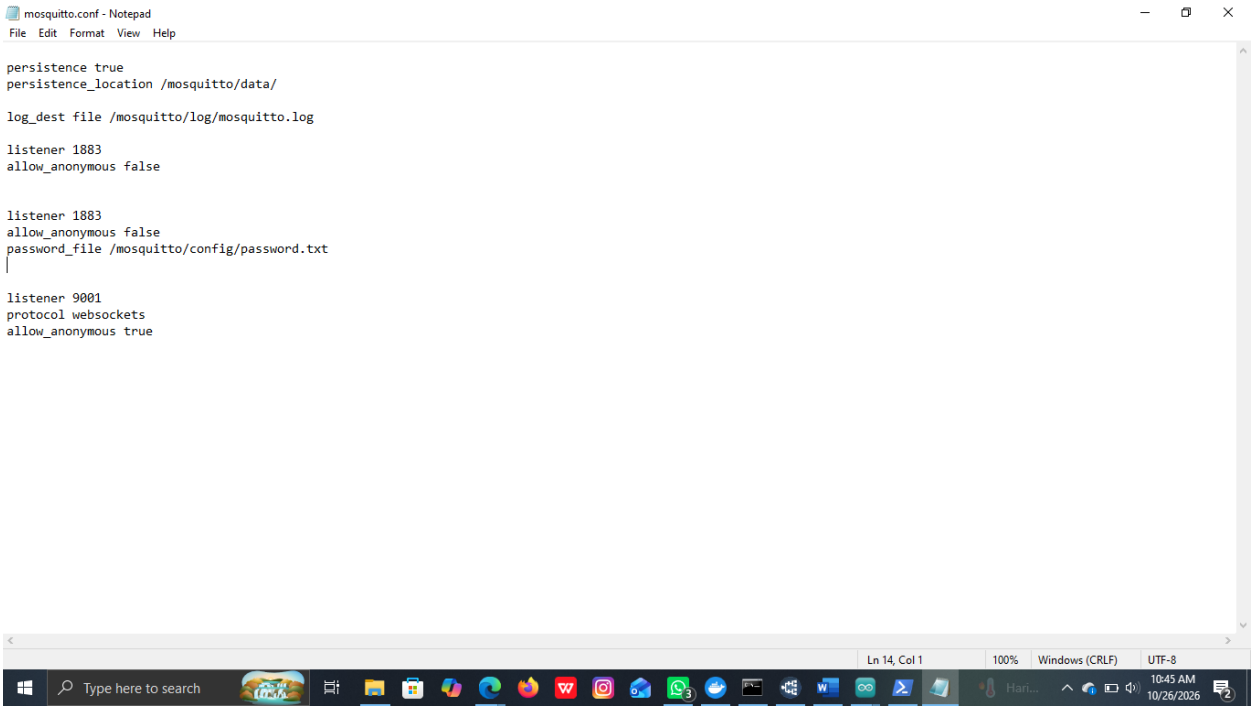

Hal yang sama berlaku pada Mosquitto. Jika pemetaan ./mosquitto/data:/mosquitto/data dihapus, data yang tersimpan di direktori tersebut tidak lagi terhubung dengan direktori host. Data yang hanya tersimpan di dalam kontainer lama dapat hilang ketika kontainer dibuat ulang.

Oleh karena itu, volume mount diperlukan untuk menjaga persistensi data agar tetap tersedia meskipun kontainer dihapus dan dibuat kembali.

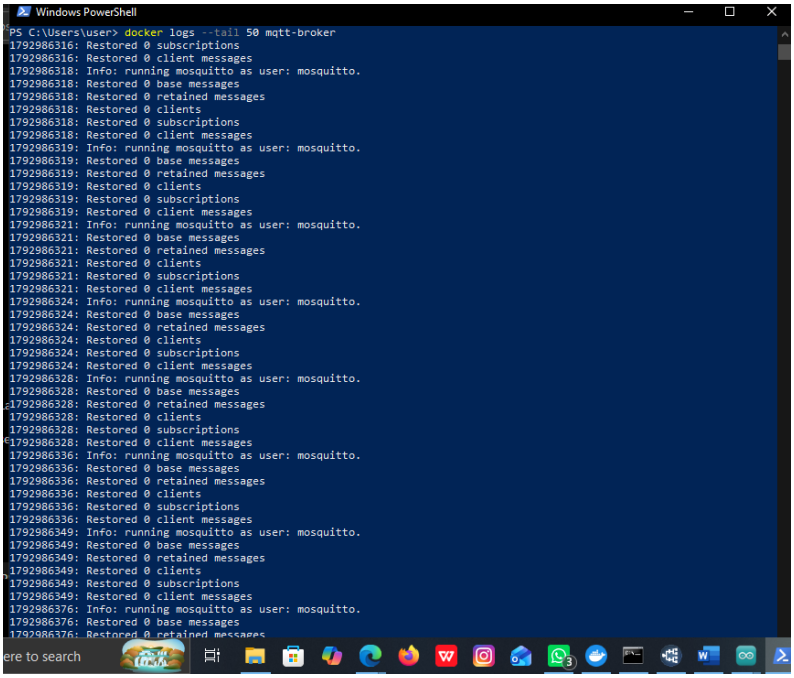

2. Bind Mount menghubungkan direktori tertentu pada komputer host dengan direktori di dalam kontainer, sedangkan Named Volume menggunakan penyimpanan yang dikelola oleh Docker. Keduanya dapat mempertahankan data ketika kontainer dibuat ulang, selama volume atau direktori penyimpanannya tidak dihapus dan pemetaannya tetap dikonfigurasi.
